

How Can PAS 402 Help Reduce Waste in Your Building Project [Back](#)

Through the creation of PAS 402, everyone in the industry can now have confidence that the construction and demolition material that goes into a skip and leaves a site will be handled according to a strict standard.

Developed in conjunction with the British Standards Institution (BSI), the specification requires waste management firms to demonstrate performance in a number of key areas of waste management, including landfill diversion and materials recovery.

It means that as a construction firm you have verifiable and authoritative information to hand when you undertake a waste management audit for a new building project. This will make it easier to assess the right contractor for the job and give you a greater chance of achieving the best and most cost-effective levels of recycling and reuse.
